

Git Flow

Supporting Branches

- There are **3** different types of supporting branches:
 1. **feature** branches
 2. **release** branches
 3. **hotfix** branches
- Each of these branches has a **specific purpose** and is bound to strict rules.

Git Flow

1. Feature Branches

- Feature/topic branches are used to **develop new features** for the upcoming future release.
- A **feature** branch exists as long as **the feature is in development**, but must be merged back into develop (to add a new feature) or deleted (if the feature is dropped).
