Git Flow

Supporting Branches

- Supporting branches are used to **aid parallel development** between team members, ease tracking of features, prepare for production releases, and to assist in fixing live production problems.

- These branches always have a **limited lifetime**, since they will be removed eventually.

Git Flow

Supporting Branches

- There are **3** different types of supporting branches:

  1. `feature` branches

  2. `release` branches

  3. `hotfix` branches

- Each of these branches has a **specific purpose** and is bound to strict rules.
